Asus rampage v extreme bios switch

Home Forums > General Topics > Troubleshooting Help > Discussion in 'Troubleshooting Help' started by Da Nine, Feb 7, 2021. Home Forums > General Topics > Troubleshooting Help > Advertisement: 05-25-2015 02:51 PM #1 My machine keeps running at max fan RPM, front panel display is useless (no error code) and I want to switch to BIOS2 boot without pulling this beast from under the desk. How to force BIOS2 boot using power button and back panel reset button? Last edited by orcinus; 05-25-2015 at 08:09 PM. 05-25-2015 02:57 PM #2 Hello To switch to BIOS 2 you need to use the onboard button provided for that purpose. 05-25-2015 03:07 PM #3 I vaguely remember there was a pattern of power button pushes for that too. Are you certain there is no such thing? Last edited by orcinus; 05-25-2015 at 04:35 PM. 05-25-2015 04:36 PM #4 05-25-2015 05:07 PM #5 It seems that neither little red button nor the circular arrow on the back or any other can change anything - machine boots to 014 then to AF code. What does that mean and how to fix it? I've tried multiple presses, full power offs, ons... nothing helped. 05-25-2015 05:27 PM #6 Also: I've tried copying 0802 BIOS CAP to FAT32 stick and used both ports, left and right at the top of the board (just below link and circular arrow buttons) with CAP files renamed to both R5E.CAP and RVE.CAP. The link button I did press for ~3 seconds, it started blinking, blinked for several times (3-4) then blinked with shorter pause two times and went off. I presume real flashback would work much longer? What am I doing wrong? (P.S. This all happened a few days after flashing BIOS 1401N - today, before going black screen, machine pushed vents to high RPM than back and like that several times. I was away when it happened, but it was crashed with all vents at max speed and any kind of reboot would not help to start. Also, machine was on stock clocks (not even XMP) for all the time so far). Last edited by orcinus; 05-25-2015 at 05:34 PM. 05-25-2015 05:44 PM #7 Assuming you're still on BIOS 1 and that's the chip you want to reflash, here's what you need to do to use the USB BIOS Flashback procedure. 1. Prepare a freshly FAT32 formatted USB pendrive. 2. Download the BIOS and extract the BIOS file to the USB pendrive. 3. Rename the file to R5E.CAP. 4. Insert the USB pendrive into the USB 2.0 port that's not beside the PS/2 port. 5. Press the ROG Connect button until a flashing LED appears, then release. 6. The flashing LED will start to blink faster and faster. When it stops blinking, the process is over. 7. Power on your system. When you power on your system, you will see a black screen and a message telling you that it's updating the BIOS. Once your system restarts, you're free to input your settings. 05-25-2015 05:50 PM #8 Originally Posted by Chino Assuming you're still on BIOS 1 and that's the chip you want to reflash, here's what you need to do to use the USB BIOS Flashback procedure. 1. The flashing LED will start to blink faster and faster. When it stops blinking, the process is over. 7. Power on your system. When you power on your system, you will see a black screen and a message telling you that it's updating the BIOS. Once your system restarts, you're free to input your settings. I did. It behaved the way I've described up there. However: I've retried the procedure by first holding circular (CMOS clear) button next to the ROG Connect button and it stayed ON. Then I've inserted my USB drive and hold ROG Connect button for around 3 seconds. It started blinking, finally, towards faster and faster blinking for like a minute or less. Will boot on soon and find out if it works fine. If I wanted to flash BIOS2, should I do anything different than this? Also, it seems that bios 1401N is not really great. I wanted it for NVME support, but not so sure now... 05-25-2015 07:41 PM #9 So, no. Still AF code, even after a successful flash (process went as described). I did power the machine, but instead of "updating screen" same AF code on the board LED and no signal to monitor. AF code says "exit boot services" - what that means? CPU LED seems to constantly glow red. Any suggestions? Last edited by orcinus; 05-25-2015 at 09:29 PM. 05-25-2015 09:26 PM #10 06-15-2016 01:50 PM #1 Hello Friends, After i read here something changed with the BIOS 3101 for some People , and i got some Windows 10 updates i try to update my BIOS again to 3101 , my BIS 2101 works fine so i belived to switch to BIOS 2 , there are some little LEDs what shows what BIOS is active now , ok i swiched to the LED to the right so i should be now on BIOS 2 OK , then the Mashine is Booting up it was on BIOS 0901 , this i wanted to update so if something isnt well i still have BIOS 2101 on BIOS 1 (Left LED) So i start the Flash update Prozess to 3101 with the Asus Suite 3 and the Flash prozess was looking good no Problems , 3 or 4 Reboots and i checked the info it showed me its now on 2101 ??? but i selected the BIOS 3101 to Flash ... i checked the LEDs on the Motherboard it had switchet to BIOS 1 again (Left LED) , ok then i tried to switch to BIOS 2 on board again , then the same it shows the reoot/Update prozess 3-4 times then again Shows BIOS 1 it switched again ... then i went to the BIOS there is BIOS Tools , also Flashback tool also copie to BIOS 1 or 2 , it showed me "Now BIOS status 2" ok Fine but this one should be now 3101 and not 2101 , ok so maybe i got confuxed and used the funktion force BIOS 1 to Boot ... then i restarts and showed again Version 2101 but "now BIOS status" say its BIOS 1 i checkit it but LED on the Motherboard have not switched at any time between these 2 LEDs , something it wrong ... can someone tell me how i find out that BOTH BIOS are corectly working i get allways version 2101 BIOS as current but what happend to my Flash from BIOS 2 to version 3101 ? is BIOS 2 now Damaged and should be repaired ? How i Find this out ? Short - 1. LEDs on mother Borad dosent Switch from BIOS 1 or 2 it shows allways BIOS 1 not important and what i Force in BIOS to boot up 1 or 2 2. Switch to BIOS 2 with Motherbord Switch changes to BIOS 1 (LED left) after 3 or 4 Reboot , i saw that but in BIOS still shows "Now BIOS status 1 or 2 " depends what i forced to boot STRANGE i got confused here a little , can someone tel me how i can be shure both BIOS are Working , because i would like this as Security backup just in case ! But now i am not shure the Backup security is still intact, please let me know how i can find this out . Thanks in advance! Nonny 06-15-2016 03:30 PM #2 Are you powering down (Shut Down from Windows) and then pushing the little red BIOS change button? ASUS Rampage V Extreme BIOS 4101 | i7-6950X | Thermaltake Core X9 | G.Skill F4-2800C16Q-32GRK | Cooler Master Nepton 280L | Dual Samsung 850EVO 500GB SSD | PSU: DARK POWER PRO 11 1000W | 3TB & 4TB HDD | NVIDIA GTX Titan X | ASUS 24x DVD±RW Drive | Win10 Pro 06-15-2016 03:51 PM #3 Originally Posted by red454 Are you powering down (Shut Down from Windows) and then pushing the little red BIOS change button? I Pressed the Button When i start the mashine or start the mashine "reset" button and directly the BIOS switch after reset the LED switch then on the Right side , but it switches back somehow - / i will check this later again and see what happens , then i write again how it looks , but i belive it switches back to BIOS 1 . Thanks 06-15-2016 11:05 PM #4 Hello again , it looks like my bios chip 1 dosnt work anymore how do i fix this , place the bios on the ush flash drive name it R5E.cap , because i dont find the bios renamer tool, and switch to bios chip 1 and power with USB flash drive plugged in on damaged bios chip one, then holding the ROG button on the back 5 sec. 7 is that corect ? Thanks ! Nonny Edit : BIOS 1 is down Q-Code is "00" and no other LEDs are on , boot loop , i tried the USB Flashback on chip 01 and it starts blinking the BIOS 1 LED and ready also from my USB flasdrive but it looks like it dosent help , still the same trouble , boot loop an Q-Code "00" ... anyone a idea how to repair the BIOS chip , i cant belive its gone i didnt do nothing stupid with it , no idea what happend here -:/ Edit 2 : I read that Copy BIOS 1 to BIOS 2 option Can damage the BIOS chip by not corect Programming of this function ?? NO right , because this is what i was trieing also , is there a way to fix this if this is the problem ?? Last edited by Nonny; 06-16-2016 at 02:09 AM. 06-16-2016 01:16 PM #5 This is ASUS BIOS Flash Back Please read careful and put switch in position 1 shutdown PC and follow procedure. You need to leave little to finish process, maybe even 2-3 minutes. 1.Do not unplug the portable storage device, power the system down, or press the CLR CMOS button while BIOS updating is ongoing, or the update will be interrupted. In case of interruption, follow the recommended procedures again to complete the BIOS update. 2. If the light flashes for five seconds and turns stable, USB BIOS Flashback is not operating properly. This may be caused by improper installation of the portable storage device, an error in the file name, or incompatibility in file formats. If this is the case, restart the system until the light clears, and check the file name and format. 3. BIOS updates may affect a PC in various ways. Should any issues with the BIOS arise as a result or your system is unable to boot, please contact your local ASUS support center for further assistance[/I] Check few video clips if need. Look careful whole video to the end and how long need to finish process 06-16-2016 01:54 PM #6 Originally Posted by Vlada011 This is ASUS BIOS Flash Back Please read careful and put switch in position 1 shutdown PC and follow procedure. Should any issues with the BIOS arise as a result or your system is unable to boot, please contact your local ASUS support center for further assistance[/I] Check few video clips if need..... loot more text -:) Thanks a lot for the time to send me this tip , i did yesterday 2 times with my USB Flash the Process as follows: Shut down mashine, Plug in the USB drive in the ROG connect port switched to BIOS chip 1 , the one that dosent boot pressed the ROG connect button for 3-5 seconds , then LED on the USB drive starts blinking (Reading from UBS drive i guess) LED from BIOS chip 1 starts blinking , first slowly after some time blinking faster - USB and BIOS LED blicking together here maybe around 2 minutes nothing blinks anymore and thats all ... sadly it stasy on code 00 So i belive this ist what i have done BUT i didnt had the new updated link from you , i will try this again later on but i belive i didnt made a mistake here anyway i will try again after taking a look into the video , i will post what happend -:) Just in case where to find a BIOS chip if needed is there a recommended contact who sells these chips ? Thanks a lot and with friendly greetings Nonny 06-17-2016 09:16 AM #7 06-17-2016 01:17 PM #8 Thanks ! I needed a recomandation because i didnt wanted to buy a chip from like an unknow seller where maybe the chips issnt working, ok i will buy from the bios-chip24.com page then Thanks a lot ! With friendly greetings Nonny 06-17-2016 02:13 PM #9 Originally Posted by Nonny Shut down mashine, Plug in the USB drive in the ROG connect port switched to BIOS chip 1 , the one that dosent boot pressed the ROG connect button for 3-5 seconds , then LED on the USB drive starts blinking (Reading from UBS drive i guess) LED from BIOS chip 1 starts blinking , first slowly after some time blinking faster - USB and BIOS LED blicking together here maybe around 2 minutes nothing blinks anymore and thats all ... sadly it stasy on code 00 So i belive this ist what i have done BUT i didnt had the new updated link from you , i will try this again later on but i belive i didnt made a mistake here anyway i will try again after taking a look into the video , i will post what happend -:) Just in case where to find a BIOS chip if needed is there a recommended contact who sells these chips ? USB BIOS Flashback 1 - Shut down mashine (computer) 2 - Plug in the USB drive (USB Flash Drive 2.0 only, 4-8gb) in the ROG connect port 3 - Power off (disconnect, de-energize) 1-2-3sec 4 - Power on (Not start computer) 5 - press the ROG connect button for 3-5 seconds 6 - BIOS update 7 - end BIOS update 8 - Start mashine (computer) Last edited by Volk; 06-17-2016 at 02:23 PM.
